The articles contained in Feedback are derived from Service Difficulty Reports (SDRs) submitted by Aircraft Maintenance Engineers (AMEs), owners, operators and other sources in accordance with Civil Aviation Regulation (CAR) 591.

Service Difficulty Reports (SDR) are normally published verbatim. Transport Canada assumes no responsibility for the accuracy or content of any of these reports. Only spelling errors are corrected and content may be reduced as well as personal references deleted.

All defects or occurrences should be reported to Transport Canada through the Service Difficulty Reporting Program. F or additional information about this program or concerning an article in Feedback magazine, contact your nearest Transport Canada Centre.

Feedback est aussi disponible en français.

TC-1002987

HANGAR NOISE

Fuel System Icing

Prior to this accident, the aircraft had been refueled and then stored in a hangar. Some two months later, the aircraft was re-activated for flight that included drainage of any residual water from the fuel tank sumps.

Approximately 45 minutes after takeoff and during cruise flight (5,500 feet ASL), the R/H engine power suddenly reduced to approximately idle power. Consequently, the pilot altered aircraft heading towards the nearest available airfield. Several minutes later, the L/H engine power diminished to producing only idle power. The aircraft was unable to maintain forward airspeed thus an emergency landing was executed into a partially treed area. Fortunately there were no fatalities, however the aircraft was deemed unrepairable.

The Transportation Safety Board of Canada (TSB) conducted an investigation and determined that suspended water in the fuel had become frozen in the forward fuel injector lines that emanate from the respective (2) fuel distribution valves. Accumulations of ice were found in selected screens and orifices of the engine fuel supply system. This effectively cut off the flow of fuel to the engines' forward cylinders, resulting in engine power loss to both engines. On this particular engine configuration, the fuel distributor valve is located at the front bottom of the engine and is directly in the ram airflow. There is also no residual heat received from the engine at this location. It is believed that the fuel in this area became super cooled enough for water in suspension to freeze.

Investigation revealed that a fuel system anti icing additive was not used by the operator nor was there a requirement.

Transport Canada Comments:

Aviation fuels still contain various amounts of dissolved water in spite of precautions adopted by refineries, transportation and distribution facilities, and aircraft servicing stations.

Water that collects at the bottom of fuel tanks or sumps is periodically drained during routine maintenance. However, a significant amount of water can remain in solution and then flow with the fuel supply to the engine(s). It is highly recommended that operators use an approved icing inhibitor in fuel systems especially during cold weather operations.

The TSB is preparing a "Safety Advisory Letter" to inform operators of the inherent problems associated with suspended water in fuel systems and aircraft operations in cold temperatures.

FIXED WING

DHC 8 100/200/300

SDR # 20071206006 & 20061025003

Severely Frayed Aileron Cables

SDR Submitted:

Following flight, a DHC 8 100 operator reported that the aileron controls were stiff (outside air temperature of -20 Celsius). Inspection of the aileron control system revealed a significantly frayed cable at WS 189. Closer examination revealed that 47 strands of cable were broken at a position where the cable crosses a roller fairlead, which was also found to have a seized (sealed) bearing. Both the L/H and R/H aileron quadrants were found to be very stiff and subsequently replaced, along with the defective roller fairlead bearing. The aileron control system is inspected every second C Check or 10,000 hours, which was carried out 7618 hours ago.

Another recent SDR, submitted by a DHC 8 300 operator, who reported that both the L/H and R/H aileron cables were found severely chafed with numerous cable strands completely severed at wing station (WS) 171. The aileron cables are carbon steel and Type 19 X 7 (7 strands with 19 wires on each strand). The L/H cable had approximately 40% of the cable strands frayed. This aircraft had logged some 16000 airframe hours since new. The Type Certificate Holder (TCH) investigated further and noted that cold weather can cause drag on all bearings and pulleys. It was also concluded that these broken cable strands were caused by wear as evidenced by a pointed sharp edge at the strand break location. The cables were found correctly tensioned to 52 pounds; however, an increase of 20% cable tension is recommended for these cold weather operators. An increase in cable tension would provide more positive contact against the aileron pulleys and fairleads and provide more responsive movement from the flight controls.

Transport Canada Comments:

The principal function of flight control fairleads is to dampen vibration, maintain cable alignment and seal the openings in bulkheads. Deflection of flight control cables in excess of 3 degrees is undesirable. Ideally, a properly rigged airplane will fly straight and level "hands off" at its normal cruising speed. If air currents disturb the stable flight attitude, the aircraft should correct itself, and resume straight and level flight.

During a cable inspection, a cloth or rag should be used to clean accumulated debris from the cable and to catch any frayed cable strands.

Aging Aircraft, a Great Reason to Look for Cracks

SDR Submitted:

During an aging aircraft inspection, a crack was detected, visually extending from the lower aft latch (position 8). When the door was removed for repair, further cracks were discovered on the attaching structure for both lower latches (positions 7 and 8).

This failure is believed to be the result of fatigue and if undetected could eventually result in failure of the cargo door. It should also be noted that FAA airworthiness directive (AD) 98-06-25 requires an inspection of the latching system.

Transport Canada Comments:

Loss of a cargo door could be catastrophic. Ensure your inspections are thorough.

EMBRAER, ERJ 170 200 SU

Missing Safety Device

SDR Submitted:

During a routine Inspection, an AME discovered that a nut on a lower drag brace attachment hinge pin was not safetied with a cotter pin and the PRC was adrift.

There was no evidence of work previously accomplished on the nose gear.

Transport Canada Comments:

Never assume assemblies are correct because they are new. Inspect all safety devices. *

Make Sure your Screws aren't Loose

SDR Submitted:

After takeoff, the crew reported they were unable to retract the flaps from the 10 degree position to the 0 degree position. The preliminary report states that a loose screw was found inside the flap lever guard. The forward right screw located inside the guard was found to be protruding sufficiently to prevent the lever from moving from the 10 degree position to the 0 degree position. All three remaining screws were found to be secure.

Transport Canada Comments:

A visual and tactile inspection should be performed to ensure that all four (4) screws located inside the flap lever guard are slightly countersunk and do not show any signs of being loose. **

EMBRAER, ERJ 190 100 IGW

Main Landing Gear Bushing

SDR Submitted:

On visual inspection during a C2 check, maintenance found a crank bolt assy bushing on the L/H main gear to have signs of rotation. Both bushings were replaced.

Transport Canada Comments:

This may be a difficult area to inspect. Be vigilant in areas where grease may hide defects. **

Service Door Up-Lock Mechanism

SDR Submitted:

Pilot reported that the service door message was displayed. Maintenance personnel were called to investigate the problem. The engineer could not open the door and started removing the door liner. Once removed, they found that the service door up-lock mechanism had broken completely. By looking at the material inside the crack it was noticed there were signs of dirt accumulation in different areas indicating that the crack was not recent.

L/H Inboard Flap Main 1 Carriage Assy

SDR Submitted:

L/H inboard flap main 1 carriage assy (Part Number (P/N) 190-92001-405) was found grooved on the inside by a loose bolt from the track assy. Embraer advised that the root cause of the damage was caused by a loose bolt in the flap track mechanism.

Landing Gear Selector Assembly

SDR Submitted:

Upon approach, the crew was unable to extend the landing gear normally and had to perform an emergency extension. A successful landing was carried out. Upon investigation, it was determined the problem was in the landing gear selector assembly. The pivot screw for the microswitch actuating lever had backed out by several threads, allowing the lever to migrate out with the screw. When the gear was selected up, the actuating lever came to rest on part of the gear selector housing. Consequently, when the crew selected gear down, the switches were not released and the gear

remained in the retracted position. Thread locking compound was applied to the pivot screw and the screw was tightened. Several gear swings were successfully completed and the aircraft was returned to service.

Transport Canada Comments:

Keep this in mind at the next scheduled inspection. The SDR database contains several previous reports related to the Landing Control Selector Assembly.

PILATUS - SW, PC-12/47E

SDR# 20080821010

New Aircraft with Human Factor Issues

SDR Submitted:

During an unrelated installation of a sat phone system, an amp type splice in the existing aircraft wiring was discovered burnt and discolored. Further inspection indicated that the wiring was for the windshield heat system. Wire No. 1H81A12 was also discolored and burnt; there were no indications of burning in the surrounding area. The burnt splice was found poorly crimped to the wire. When the wire was untied for

repair it fell out of the splice. The adjacent splice was damaged and required replacement. A further inspection found all four splices were improperly crimped. The remainder of the windshield heat wiring inspection was completed and no faults found.

The wires 1H83A12, 1H85A12, 1H80B12, 1H81A12 and splices were all replaced and a function test of the windshield heat system completed.

Transport Canada Comments:

This was a new delivery aircraft with 19 airframe hours. Undetected, this eventually would have become a defect for the windshield heat system resulting in expensive downtime. *

Flash Fire in Cockpit

SDR Submitted:

A turbo beaver was conducting pre-taxi checks in preparation for takeoff when suddenly the hydraulic pump supply line located in the cockpit centre console area developed a pin-hole leak and sprayed atomized hydraulic fluid into the pilot's seat area.

The electrical power wire for the hydraulic pump had arced against the tubing and ignited the atomized hydraulic mist starting a flash fire. Fortunately, the fireball was unable to sustain itself and did not ignite the whole aircraft. The pilot's upper body suffered 1st and 2nd degree burns to his face and right hand. A crewmember who was sitting in the L/H seat did not receive any injuries, thus he was able to extinguish the fire, possibly saving the pilot's life. There was the potential for a more serious event as the aircraft was carrying two drums of fuel at the time of this event.

The SDR submitter stated that the hydraulic system configuration has been in the aircraft since the date of manufacture, but does not match routing shown in the IPC. After a thorough records search (since manufacture) the SDR submitter was unable to find any mention of the lines being replaced or installed. The operator has been in possession of the aircraft since the early 1900's and has never modified or changed the set-up it arrived with.

Subsequently, the operator replaced the affected hydraulic lines in the cabin and installed a fire sleeve to help prevent a reoccurrence. The electrical wire connections were inspected and protected as required.

Transport Canada Comments:

This article is a reminder to personnel of the importance of inspecting and protecting electrical connections.

Flap Rod Interference

SDR Submitted:

During an inspection on this aircraft, it was discovered that the L/H inboard chord-wise flap rod was rubbing against the span-wise rod. Once the assembly was removed from the aircraft, it was noted that the span-wise rod had a groove worn in it from the other rod. At this time, it was noted that the bellcrank support structure was possibly not situated correctly leading to a lack of clearance between the 2 rods. The defective flap rod was replaced.

Both the "re-lifed wing" assemblies were sent back to the supplier. It was then discovered that the bearing blocks for the bellcrank were not installed correctly thereby causing the chordwise rod to move up slightly when the flaps were deployed. The bearing blocks were replaced and the aircraft was returned to service.

ROTORCRAFT

BELL 206

SDR # 20071029001

Cracked Pitch Horn Grip

SDR Submitted:

A crack can be seen on the inside of the pitch horn leading from the seal-seating surface to the grip-mating surface. On the inner side where the hole for the relief valve is, the crack is about 1/8 of an inch above the corner where the seal seats all the way through.

The crack can be seen on the inside of the relief valve hole also.

Transport Canada Comments:

Although this defect was discovered during overhaul, it should be kept in mind while inspecting the hubs in service.

Main Transmission

SDR Submitted:

Upon descent during heli-portable seismic drilling operations with an external load, the master caution warning indication illuminated. The pilot checked the caution panel to find a transmission oil pressure caution light illuminated and the transmission oil pressure gauge indicating zero pressure.

A post-shutdown inspection conducted by the AME revealed an abundance of aluminum metal shavings in the oil system and oil filter. Further disassembly and

inspection of the oil pump indicated even more metal shavings but the origin of the material could not be determined.

Transport Canada Comments:

After further inspection of the transmission, it was discovered that the lower bearing race retaining nut on the mast assembly had broken free of its torque and locking device.

The nut backed off all the way to the last thread, carving a one-inch deep groove into the transmission sump case. *

BELL TEXTRON - USA 205A 1

SDR # 20080604011

Bell 205 Lift Link

SDR Submitted:

While conducting a 25-hour inspection, a crack was noted on the lift link beam lug. The part was removed and total time of the beam is unknown at this time. The crack was found on the aft ear of the lug on the R/H side.

Transport Canada Comments:

The SDR database revealed numerous SDRs reporting this defect. Due to the location of the lift link, extra attention is required during inspection.

Tail Rotor Pitch

SDR Submitted:

The pitch change rod end-bearing ball was found separated from the pitch link. The pilot reported that the tail rotor felt different upon landing, the pilot conducting a post flight inspection discovered the defect. An AME was dispatched to attend to the problem. Both pitch change rods were replaced and the helicopter was returned to service.

ENGINES

ROLLS ROYCE BR700-715A1-30

SDR # 20071219003

High Pressure Turbine (HPT) Stage 1 - Blade Release

SDR Submitted:

There have been recent SDRs reporting the realease of HPT Stage 1 blade(s). The blade(s) fractured beneath the inner blade platform. In several cases, replacement HPT blades were installed during the last shop visit in accordance with manufacturers Service Bulletin (SB) 72-101467 to upgrade to the latest turbine blade (BR700-715 series).

Rolls Royce is pro-actively addressing the engines at risk for the replacement of the HP1 turbine blades and is currently investigating all SDR reports to establish root cause of these blade fractures. Recently, Rolls Royce issued Worldwide Communication WW/20199/4/20 December 2007, addressed to All BR 715 operators.

Transport Canada Comments:

Pending identification of root cause by the manufacturer, Transport Canada recommends that operators comply with the most recent Rolls Royce Service Bulletins.

PROPELLERS

P&WC PT6A-50 (DHC 7 102)

SDR # 20071217004

Unsecured Teleflex Cable - Propeller and Fuel Control Linkage

SDR Submitted:

While carrying out a post flight shutdown, the No. 2 Condition Lever would not feather the propeller or shut off the fuel supply (via a cam mechanism) to the subject engine. As a result, the emergency shutdown "T" handle had to be used. Further investigation revealed the No. 2 Teleflex cable had become unscrewed near the bearing. The operator was unaware that the cable could become unscrewed at this location, as there is no visual indication (lockwire or witness paint). Another aircraft in the operator's fleet was also found to have a partially unscrewed Teleflex cable.

When correctly assembled, there should be no threads visible between the Teleflex cable housing and the bearing. (Reference: P&WC IPC 76-10-00, Page 2 Item 290A). A specified torque value of 50 inch/pounds and a loc-tight compound is required to be applied to the threads. It appears that the above step was missed during the last C Check, some 300 hours ago.

Transport Canada Comments:

The Teleflex cable controls the positions of the propeller governor and the engine fuel cutoff. The propeller governor is initiated first, and then through a cam mechanism before the fuel cutoff is initiated.

Unfortunately, human factors were the primary cause of this event. *

P&WC (USA) R-985-AN-14B (BEECH D18S)

Crankshaft Counterweight Engine Failure

About 20 miles NW of its destination, a Beech D18S floatplane had just descended to avoid some adverse weather, when suddenly a violent vibration shook the aircraft. The left engine momentarily ran extremely rough and then abruptly quit. The situation was indeed serious. The critical engine failed and the propeller was neither rotating nor in "feather position", thereby causing significant aerodynamic drag. The pilot was barely able to maintain airspeed of 80 knots with maximum power on the right engine and was forced into a 25-knot downwind situation in order to make the nearest lake.

The pilot had no idea what caused the engine failure but was thankful that there was no fire. There was no evidence of oil leakage; however, a large bulge was noticed in the top cowling. The pilot then assumed that a blown cylinder had occurred, however, it was not understood why the propeller would not go to feather position. The subsequent loss of performance was very serious.

Fortunately, the landing on the lake was successful and the pilot was able to maneuver the aircraft for an "into the wind" landing. Shortly after touchdown, the pilot taxied the aircraft to a nearby dock. After securing the aircraft, the pilot also noted a very large hole in the crankcase of the failed engine. It was apparent that debris from the failed engine had severed off a portion of the left propeller blade, which then penetrated the nose section of the aircraft in the vicinity of a gas tank. Another piece of engine debris had penetrated the inside of the left float, fortunately above the water line.

In the process of dismantling the failed engine, the AME discovered a large portion of the crankshaft forward counterweight had broken free and was lying in the cavity of No. 1 cylinder. It appeared that the failed counterweight then took out both No. 1 & 2 cylinders causing the abrupt engine stoppage and severe internal engine damage.

Transport Canada Comments:

The engine was sent to the Transportation Safety Board of Canada (TSB) to determine the root cause of the failure. Because of severe internal damage, the engine had to be sawed into several sections before investigation was possible. Initial visual examination revealed that the forward counterweight assembly had separated from its crankcheek. The liberated counterweight caused severe and extensive damage to the cylinder skirts, connecting rods, pistons and crankcase. The No. 1 cylinder assembly had completely separated from the crankcase. Pounding damage from interaction between the rotating crankshaft and the separated counterweight had so deformed the front section of the crankcase that the screw heads from the rocker oil manifold were imprinted onto the crankcase.

Further investigation of the failed crankcheek revealed that it had fractured as a result of fatigue cracking, beginning at a drilled rivet hole that retains the counterweight to the crankcheek. It was determined that this fatigue crack (low stress/high cycle) was in existence for an extensive period of time; long before the last time between overhauls TBO (250 hours ago). Evidence revealed that the rivet hole had been drilled with a dull drill bit during the initial manufacturing process. The rough edges had eventually created a stress riser leading to a fracture, which did not occur until many years later.

The design of this crankshaft makes crack detection on the specific crankshaft cheek rivet bore extremely difficult. Magnetic Particle Inspection (MPI) will almost certainly not detect cracks in this case, because the origin area in question is hidden by the inner and outer pieces of counterweight material. Ultrasonic inspection may be an option if an approved procedure were developed that would reliably detect cracks in the subject area. Alternatively, disassembly of the front counterweight assembly would be necessary to reliably inspect for cracks initiating from the rivet bore in crankshaft cheek, but may not be practical or may introduce new issues upon reassembly. It is now clear that it would be impossible to properly carry out an MPI inspection in this area.

EQUIPMENT ADS

Transport Canada (TC) endeavours to send copies of new airworthiness directives (ADs), which are applicable in Canada to the registered owners of the affected products. Equipment/appliance ADs are often only distributed to our regional offices because the owners of aircraft affected by this type of AD are not generally known.

TC has received the following new ADs on equipment in the last three months. AMEs and operators of the affected products are encouraged to obtain further information or a copy of the ADs from their regional TC office, their local TCC, their PMI, or from the Civil Aviation AD website at: www.tc.gc.ca/cawis-swimn

SUSPECTED UNAPPROVED PARTS

The submitters of the following Service Difficulty Reports (SDRs), received during the previous quarter, indicated that an unapproved part (SUP) was suspected. The list is provided here for information only and should not be construed as an identification of confirmed unapproved parts.

In Canada, SUPs should be reported in accordance with Canadian Aviation Regulation (CAR) 591.01, indicating your suspicion of an unapproved part on a regular SDR form or on the Internet at: www.tc.gc.ca/wsdrs

FAA UNAPPROVED PARTS NOTIFICATIONS (UPNs)

Unapproved parts notifications (UPNs) are published by: FAA, AIR-140, P.O. Box 26460, Oklahoma City, OK 73125. They are posted on the Internet at: www.faa.gov/aircraft/safety/programs/sups/upn

No. 2008 - S20071128005 issued January 30, 2008

AFFECTED PARTS

Engine rotating groups and components.

PURPOSE

The purpose of this notification is to advise all aircraft owners, operators, manufacturers, maintenance organizations, and parts suppliers and distributors regarding improper maintenance performed on engine rotating groups and components.

BACKGROUND

Information received during a Federal Aviation Administration (FAA) suspected unapproved parts investigation revealed between June 2007 and November 2007 Genuine Repairs Aerospace, Inc., located at 6993 N.W. 82 Avenue, Bay 30, Miami, FL 33166, improperly maintained and approved for return to service engine rotating groups and components contrary to the regulations. Genuine Repairs Aerospace, Inc., formerly held Air Agency Certificate No. U16R185Y with limited powerplant rating.

Evidence indicates Genuine Repairs Aerospace, Inc., approved engine rotating groups and components for return to service that were not maintained in compliance with the manufacturer's maintenance manuals or other data or methods acceptable to the FAA and performed nondestructive testing of parts using equipment that was not calibrated, was improperly calibrated, or was overdue calibration.

RECOMMENDATIONS

Regulations require that type-certificated products conform to their type design. Aircraft owners, operators, manufacturers, maintenance organizations, and parts suppliers and distributors should inspect their aircraft, aircraft records, and/or parts inventories for any engine rotating group parts and components approved for return to service by Genuine Repairs Aerospace, Inc. Appropriate action should be taken if any referenced affected parts have been installed on an aircraft. If any existing inventory includes these affected parts, the FAA recommends you quarantine the affected parts to prevent installation on an aircraft until a determination can be made regarding eligibility for installation.

FURTHER INFORMATION

Further information concerning this investigation, and guidance regarding the referenced affected parts, can be obtained from the FAA Flight Standards District Office (FSDO) given below.

The FAA would appreciate any information concerning the discovery of the referenced affected parts, the means used to identify the source, and the actions taken to remove the affected parts from aircraft and/or stock. UPN 2008- S20071128005

This notice originated from the FAA South Florida FSDO, 8600 N.W. 36 Street, Suite 201, Miami, FL 33166, telephone (305) 716-3400, fax (305) 716-3437.

A partial list of affected parts approved for return to service by Genuine Repairs Aerospace, Inc. can be viewed at: www.faa.gov/aircraft/safety/programs/sups/upn/media/2008/UPN_2008-S20071128005.pdf

No. 2008-S200708310320 issued February 6, 2008

AFFECTED PARTS

Cabin controllers and outflow valves.

PURPOSE

The purpose of this notification is to advise all aircraft owners, operators, manufacturers, maintenance organizations, and parts suppliers and distributors regarding improper maintenance performed on cabin controllers and outflow valves.

BACKGROUND

Information received during a Federal Aviation Administration (FAA) Suspected Unapproved Parts (SUP) investigation revealed between June 2006 and October 2007 Ford Instruments and Accessories, LC, located at 6855 Tico Road, Suite 11, Titusville, FL 32780, improperly maintained, overhauled, and approved for return to service cabin controllers and outflow valves manufactured by Airesearch/Honeywell contrary to the regulations. Ford Instruments and Accessories, LC, holds FAA Air Agency Certificate No. F2UR186Y with limited accessory, limited instrument, and limited radio ratings.

Evidence indicates that Ford Instruments and Accessories, LC, approved cabin controllers and outflow valves for return to service that were not maintained in compliance with the manufacturer's maintenance manuals or other data acceptable to the FAA. Discrepancies include:

- 1. failure to perform required tests and inspections
- 2. failure to complete requisite repair and overhaul process steps and
- converting and/or modifying appliances without using approved data.

RECOMMENDATIONS

Regulations require that type-certificated products conform to their type design. Aircraft owners, operators, manufacturers, maintenance organizations, and parts suppliers and distributors should inspect their aircraft, aircraft records, and/or parts inventories for any cabin controllers and outflow valves approved for return to service by Ford Instruments and Accessories, LC.

Appropriate action should be taken if any referenced affected parts have been installed on an aircraft. If any existing inventory includes these affected parts, the FAA recommends that you quarantine the affected parts to prevent installation on an aircraft until a determination can be made regarding eligibility for installation.

FURTHER INFORMATION

Further information concerning this investigation, and guidance regarding these affected parts, can be obtained from the FAA Flight Standards District Office (FSDO) given below. The FAA would appreciate any information concerning the discovery of the referenced affected parts, the means used to identify the source, and the actions taken to remove the affected parts from aircraft and/or stock.

This notice originated from the FAA North Florida FSDO, 5950 Hazeltine National Drive, Citadel International, Suite 500, Orlando, FL 32822, telephone (407) 812-7725, fax (407)-812-7710. Below is a partial list of parts manufactured by Airesearch/ Honeywell that were approved for return to service by Ford Instruments and Accessories, LC.

A partial list of parts manufactured by Airesearch/ Honeywell that were approved for return to service by Ford Instruments and Accessories, L.C. Can be viewed at:

www.faa.gov/aircraft/safety/programs/sups/upn/media/2008/UPN_2008-S20070831032.pdf

No. 2008-S20080110024 issued March 25, 2008

AFFECTED PARTS

Boeing 707, 747, 757, and 767 series main landing gear (MLG) truck beams.

PURPOSE

This notification advises all aircraft owners, operators, manufacturers, maintenance organizations, parts suppliers, and parts distributors regarding improper maintenance performed on main landing gear (MLG) truck beams used on large aircraft.

BACKGROUND

Information received during a Federal Aviation Administration (FAA) investigation revealed that between January 1, 2001, and November 26, 2007, AAR Landing Gear Services, located at 9371 NW 100th Street, Miami, FL 33178, improperly maintained and approved for return to service Boeing 707, 747, 757, and 767 series MLG truck beams. AAR Landing Gear Services holds FAA Air Agency Certificate No.VQ4R605M, with class one accessory, limited accessory, limited airframe, limited landing gear components, and limited nondestructive testing ratings.

Evidence indicates AAR Landing Gear Services approved MLG truck beams for return to service that were not maintained in accordance with the manufacturer's maintenance manuals. Discrepancies noted in AAR Landing Gear Services' practices included, but are not limited to, the following:

- Approved for returned to service MLG truck beams as overhauled with the application of BMS 10-60, Type 1, Boeing color 707 gray gloss enamel inside the surface area of the truck beams, contrary to the manufacturer's components maintenance manuals.
- Failure to document in the maintenance records application of BMS 10-60, Type 1, Boeing color 707 gray gloss enamel inside the surface area of the truck beams or deviations from the manufacturer's components maintenance manuals.
- Failure to document in the maintenance records and approved for return to service Boeing 757 MLG truck beams with the application of BMS 10-60, Type 1, Boeing color 707 gray gloss enamel inside the surface area of the truck beams, contrary to the manufacturer's components maintenance manuals and Alert Service Bulletin No. 757-32A0135 directed by Airworthiness Directive 2001-09-01.

RECOMMENDATIONS

Regulations require that type-certificated products conform to their type design. We encourage aircraft owners, operators, manufacturers, maintenance organizations, parts suppliers, and parts distributors to inspect their aircraft, aircraft records, and/or parts inventories for any Boeing 707, 747, 757, and 767 MLG truck beams approved for return to service by AAR Landing Gear Services between January 1, 2001, and November 26, 2007. If you find any MLG truck beams installed on any Boeing 707, 747, 757, and 767 aircraft, you should take appropriate action. If you find any MLG truck beams in existing inventory, we recommend quarantine to prevent installation until each MLG truck beams' eligibility for installation is determined.

A list of known Boeing 707, 747, 757, and 767 series MLG truck beams approved for return to service by AAR Landing Gear Services can be viewed at:

www.faa.gov/aircraft/safety/programs/sups/upn/ media/2008/UPN_2008-S20080110024.pdf

FURTHER INFORMATION

You can obtain further information and guidance regarding the referenced Boeing series aircraft MLG truck beams from the FAA Flight Standards District Office (FSDO) given below. In addition to all the above recommendations, the FAA would appreciate any information concerning the discovery of the Boeing series MLG truck beams from any source, the means used to identify the source, and action taken to remove the MLG truck beam assemblies or aircraft accessories from service.

This notice originated from the FAA South Florida FSDO-19, 8600 NW 36th Street, Suite 200, Miami, FL 33166, telephone (305) 716-3400, fax (305) 716-3458.

No. 2008-200700130 issued on March 26, 2008

Affected Products

The Nichols Airborne F7-51 series electronic controller. The Nichols Airborne F7-51 controller is a subcomponent of Nichols 1H85 airborne ambient and bleed airflow control systems installed on Beech Super King Air. Beech part numbers 101-380025-11 and 101-380025-17 are the equivalent of Nichols Airborne part numbers F7-51-3 and F7-51-5, respectively.

PURPOSE

This notification advises all aircraft owners, operators, manufacturers, maintenance organizations, part suppliers, and parts distributors regarding improper maintenance performed on aircraft accessories.

BACKGROUND

Information received during a Federal Aviation Administration (FAA) suspected unapproved parts investigation revealed that between July 2005 and July 2007 Stevens Aviation, Inc., located at 3500 Hangar Drive, Vandalia, OH 45377, improperly repaired or overhauled and approved for return to service various electronic controllers. Stevens Aviation, Inc., holds FAA Air Agency Certificate No. VIB4368K.

Evidence indicates Stevens Aviation, Inc., approved electronic controllers for return to service that were not repaired or overhauled in accordance with the methods, techniques, and practices prescribed in the current manufacturer's maintenance manuals.

Stevens Aviation Inc. has attempted to notify its customers through recall letters; however, some of the electronic controllers could not be located.

RECOMMENDATIONS

Regulations require that type-certificated products conform to their type design. Aircraft owners, operators, maintenance organizations, part suppliers, and parts distributors should inspect their aircraft, aircraft records, and/or parts inventories for any electronic controller work accomplished between July 2005 and July 2007 by Stevens Aviation, Inc. If you find any electronic controllers installed on aircraft, you should take appropriate action. If you find any electronic controllers in existing inventory, we recommend quarantine to prevent installation until each controller's compliance with the manufacturer's maintenance manuals is determined.

A partial list of electronic controllers that Stevens Aviation, Inc., may have repaired or overhauled and approved for return to service can be found at: www.faa.gov/aircraft/safety/programs/sups/upn/media/2008/UPN_2008-200700130.pdf

FURTHER INFORMATION

You can obtain further information concerning this investigation and guidance regarding the above-referenced electronic controllers from the FAA Flight Standards District Office (FSDO) given below. In addition to the above recommendations, the FAA would appreciate any information concerning the discovery of the electronic controllers from any source, the means used to identify the source, and the action taken to remove the controllers from service.

This notice originated from the FAA Cincinnati FSDO, 4358 Ferguson Dr., Cincinnati, OH 45245, telephone (513) 842-9600, fax (513) 842-9620.

No. 2008-200600159 issued on March 26, 2008

AFFECTED PRODUCTS

Honeywell Model IVA-81A, display indicators for Traffic Alert and Collision Avoidance Systems (TCAS) installed in transport category airplanes.

PURPOSE

This notification advises all aircraft owners, operators, manufacturers, maintenance organizations, parts suppliers, and parts distributors regarding improper maintenance performed on Honeywell Model IVA-81A, TCAS display indicators.

BACKGROUND

Information received during a Federal Aviation Administration (FAA) investigation revealed that Aeronautical Technology, Inc., d.b.a. Aero Technology, a certificated repair station located at 3333 East Spring Street, Suite 311, Long Beach, CA 90806, overhauled and approved for return to service Honeywell Model IVA-81A, TCAS display indicators contrary to the regulations. Aeronautical Technology, Inc., holds FAA Air Agency Certificate No. DQ3R458L.

Evidence indicates that Aero Technology approved display units that it did not overhaul in compliance with the methods, techniques, and practices prescribed in the current manufacturer's maintenance manuals. Specifically, Aero Technology failed to install the required parts and correct part numbers during assembly of the display indicators. Discrepancies included, but are not limited to, the following:

- Failure to install all required parts listed in the Honeywell parts manual and service bulletin ATA No. IVA-81A-34-63 (Pub No. 4693).
- Failure to install the proper TCAS liquid crystal display in the Honeywell IVA-81A, Honeywell part number 043-20073-0005 and,
- Failure to use proper test equipment in making airworthiness determinations for return to service of the display units.

A partial list of TCAS display units that Aero Technology overhauled and approved for return to service can be found at: www.faa.gov/aircraft/safety/programs/sups/upn/media/2008/UPN_2008-200600159.pdf

RECOMMENDATIONS

Regulations require that type-certificated products conform to their type design. We encourage aircraft owners, operators, manufacturers, maintenance organizations, parts suppliers, and parts distributors to inspect any aircraft, aircraft records, and/or parts inventories for any Honeywell IVA-81A TCAS display unit repaired, overhauled, and approved for return to service by Aeronautical Technology. If you find any referenced unit installed, you should take appropriate action. If you find any display unit in existing inventory, we recommend quarantine to prevent installation until each display unit's eligibility for installation is determined.

FURTHER INFORMATION

You can obtain further information concerning this investigation and guidance regarding the referenced display units from the FAA Flight Standards District Office (FSDO) given below. In addition to the above recommendations, the FAA would appreciate any information concerning the discovery of the Honeywell IVA 81A TCAS displays from any source, the means used to identify the source, and the action taken to remove the display from aircraft and/or stock. This notice originated from the FAA Kansas City FSDO, 901 Locust Street, Room 403, Kansas City, MO 64106, and telephone (816) 329-4000, fax (816) 329-4010.

No. 2008-S20070083021 issued on March 27, 2008

Affected Products

Piper Comanche aircraft (all models) and Twin Comanche aircraft (all models) fuel selector valves, landing gear transmissions, flap transmissions, landing gear motors and armatures, flap motors and armatures, heater regulator valves, Delco generators, Weldon boost pumps, and Airborne fuel selector valve/filter assembly (part number 1H7-x).

PURPOSE

This notification advises all aircraft owners, operators, manufacturers, maintenance organizations, parts suppliers, and parts distributors regarding aircraft parts sold, repaired, or overhauled by Robert A. Weber and/or Johnathan F. Regier, d.b.a. Webco Aircraft Company.

BACKGROUND

Information received during an FAA suspected unapproved parts investigation revealed that Robert A. Weber, and/or Johnathan F. Regier d.b.a. Webco Aircraft Company, located at 1134 North Oliver Road, Hangar G, Newton, Kansas 67114, maintained and altered Piper Comanche aircraft (all models) and Twin Comanche aircraft (all models) landing gear transmissions, flap transmissions, landing gear motors or armatures, flap motors or armatures, heater regulator valves, Weldon boost pumps, and Airborne fuel selector valve/filter assembly (part number 1H7-x) contrary to the regulations. Webco Aircraft is a noncertificated repair facility. Robert A. Weber and Johnathan F. Regier both hold mechanic certificates with airframe and powerplant ratings. The FAA has not been able to determine the number of affected parts or the exact time span the improper maintenance occurred. Discrepancies include, but are not limited to the following:

- Approving for return to service parts described as having been repaired and altered without using methods techniques and practices acceptable to the Administrator.
- Plating and approving for return to service corroded and worn parts without using data approved by the Administrator.
- 3. Altering and/or modifying landing gear and flap motor armatures without using approved data.
- Installing unapproved, "off the shelf" bearings and roller balls in landing gear and flap transmissions as well as Weldon boost pumps.
- 5. Using Cessna flap transmissions used parts with no traceability in the repair of Piper flap transmissions.
- 6. Using parts with no traceability in the repairs; and
- Failing to use proper test equipment in making airworthiness determinations for return to service of the listed products.

RECOMMENDATIONS

Regulations require that type-certificated products conform to their type design. We encourage aircraft owners, operators, manufacturers, maintenance organizations, parts suppliers, and parts distributors to inspect their aircraft, aircraft records and/or aircraft parts inventory for the referenced parts which may have been sold, repaired or altered by Webco Aircraft Company, Robert A. Weber and/or Johnathan F. Regier. If you find any of these affected parts installed on any aircraft, you should take appropriate action. If you find any referenced parts in existing inventory, we recommend quarantine to prevent installation until each part's eligibility for installation is determined.

Attached is a partial list of parts approved for return to service by Robert A. Weber and/or Johnathan F. Regierd.b.a. Webco Aircraft Company.

FURTHER INFORMATION

Further information concerning this investigation can be obtained from the FAA Flight Standards District Office (FSDO) given below. In addition to the above recommendations, the FAA would appreciate any information concerning the discovery of the referenced parts from any source, the means used to identify the source, and the actions taken to remove the parts from aircraft and/or parts inventories.
